

Forza Componenti

- *Manually Control the exhaust bypass valves on your Ferrari or Maserati*
- *Open up your exhaust valves at any speed or engine RPM*
- *Enjoy the sound of your Ferrari at all times*

If you have exhaust bypass valves on your Ferrari, the engine ECU controls the opening and closing of those valves. They likely open when engine RPM reaches a threshold of 4000 to 5000 RPM and the throttle demand is high. The engine noise is intoxicating.

But at lower speeds, the car has reduced noise when the bypass valves close. This is done to meet EU noise abatement regulations.

With our Exhaust Bypass Valve Controller you can manually control the exhaust bypass valve operation. You can have the valves open under all conditions to enjoy the signature Ferrari sound at all speeds. And, at any time, you can return full control of the valves back to the vehicle's ECU.

- Complete DIY Kit includes control module, remote control transmitter and connection cables
- No CEL codes
- Option to use manual switch that can be installed on vehicle dashboard
- No modification to vehicle wiring, no splicing. Everything is plug-and-play

\$375 for complete kit
